## Chapter 6. Joint Distribution 6.3 Covariance & Correlation

GuanNan Wang  
gwang01@wm.edu

# Theorem

## Theorem 6.5

If  $X$  and  $Y$  are random variables with finite population variances and covariance, then

$$V(X + Y) = V(X) + V(Y) + 2Cov(X, Y).$$

# Example 1

## Example 1

A fair coin is tossed twice. Let  $X$  be the number of heads that appear and  $Y$  be the number of tails that appear. Find the population variance of  $X + Y$ .

# Theorem

## Theorem 6.6

If  $X$  and  $Y$  are independent random variables, then  $\text{Cov}(X, Y) = 0$ .

# Example 2

## Example 2

Show that the random variables  $X$  and  $Y$  that are uniformly distributed over the support  $\mathcal{A} = \{(x, y) | 1 < x^2 + y^2 < 4\}$  have a population covariance 0 and are dependent random variables.

# Theorem

## Theorem 6.7

If  $X$  and  $Y$  are independent random variables, then

$$V(X + Y) = V(X) + V(Y).$$

## Correlation

Let  $X$  and  $Y$  be random variables with finite population means  $\mu_X$  and  $\mu_Y$ , and finite population variances  $\sigma_X^2 > 0$  and  $\sigma_Y^2 > 0$ , respectively. The **population correlation** between  $X$  and  $Y$  is

$$\rho = \frac{E\{(X - \mu_X)(Y - \mu_Y)\}}{\sigma_X \sigma_Y}.$$

# Theorem

## Theorem 6.8

If  $X$  and  $Y$  are independent random variables, then  $\rho = 0$ .

# Theorem

## Theorem 6.9

If  $X$  and  $Y$  are random variables with population correlation  $\rho$ , then  $-1 \leq \rho \leq 1$ .

# Example 3

## Example 3

Let the discrete random variables  $X$  and  $Y$  have joint probability mass function  $f(x, y)$  given by the entries in the table. Find the population correlation between  $X$  and  $Y$ .

	1	2	3	$f_X(x)$
1	0.2	0.1	0.3	0.6
2	0.1	0.1	0.2	0.4
$f_Y(y)$	0.3	0.2	0.5	1

## Theorem 6.10

Let  $X$  and  $Y$  be random variables with population correlation  $\rho$ . The population correlation  $\rho$  equals  $-1$  iff the support of  $X$  and  $Y$  lies on a line with negative slope. The population correlation  $\rho$  equals  $1$  iff the support of  $X$  and  $Y$  lies on a line with positive slope.

- ▶ A population correlation of  $-1$  between the random variables  $X$  and  $Y$  is often known as a **perfect negative correlation**.
- ▶ A population correlation of  $1$  between the random variable  $X$  and  $Y$  is often known as a **perfect positive correlation**.

## Example 4

### Example 4

A fair coin is tossed twice. Let  $X$  be the number of heads that appear and  $Y$  be the number of tails that appear. Find the population correlation between  $X$  and  $Y$ .
